

Pervaide®

High Grade Non-Ionic Soil Penetrant

Doing More With Less Water

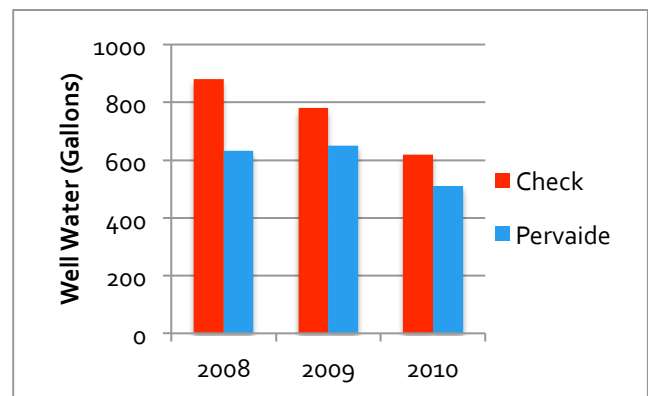

When your soil can readily absorb and hold water, your soil will be more efficient and productive while using less water. Pervaide is designed to dramatically increase water retention and aeration as well as improve physical soil properties. How does Pervaide do this? The non-ionic soil penetrant reduces surface tension cohesive properties of water allowing it to be more thoroughly and uniformly absorbed and retained in the soil profile. Pervaide also contains ingredients that stimulate microbiological activity that will improve soil physical structure regardless of soil type.

What to expect when using Pervaide...

- Increases water absorption and holding capacity (even on sloped terrain)
- Reduces runoff and water loss
- Reduces fertilizer loss
- Optimizes air/water mixture and availability
- Increases nutrient availability
- Improves soil structure

How much more water can Pervaide keep in your soil?

This chart shows the amount of water lost through the soil profile with and without using Pervaide in independent research trials. On average, Pervaide reduced the amount of water lost through the soil profile by 21%. This demonstrates Pervaide's ability to increase water retention.
